Machine Learning

Projects

BLOG-APP

The Blog App is a full-stack MERN application where users read and comment on articles, authors create, update, delete content, and admins oversee user and author activities. It ensures role-based access control for security, allowing authors to manage articles while providing a dynamic and interactive blogging experience.

Tech Stack: HTML, CSS, JavaScript, MERN Stack (MongoDB, Express.js, React.js, Node.js).

Online Auction System

The **Online Auction System** is a dynamic web-based application that facilitates real-time bidding between buyers and sellers in a virtual marketplace. It enables users to auction goods and services transparently, ensuring fair pricing and competitiveness. It incorporates predictive analytics using machine learning to estimate closing prices, enhancing decision-making for both buyers and sellers.

Tech Stack: Machine Learning, Streamlit

Gate Pass Management System

A Gate Pass Management System is a full-stack project that automates the process of managing entry and exit permissions for individuals or vehicles. It includes role-based access control, real-time notifications, and secure record tracking. The system ensures efficient, secure, and streamlined operations for organizations.

Tech Stack : HTML, CSS, JavaScript, MERN-Stack, and SQL.

Professional Experience

2025 Mar – 2025 May

Hyderabad, INDIA

Self-Employed

Worked as a Self-Employed Frontend Developer on the project *Echoes of Extinction*, a React-based web platform aimed at raising awareness about endangered species.

Designed and implemented reusable components for displaying species cards with dynamic detail pages. The project followed clean UI/UX principles and leveraged a modular, component-based architecture in React to ensure scalability.
